

Lab7 : ASP.NET CORE APPLICATION DEVELOPMENT (3 layers model software architecture)

Exercise 1: Create an ASP.NET Core Project

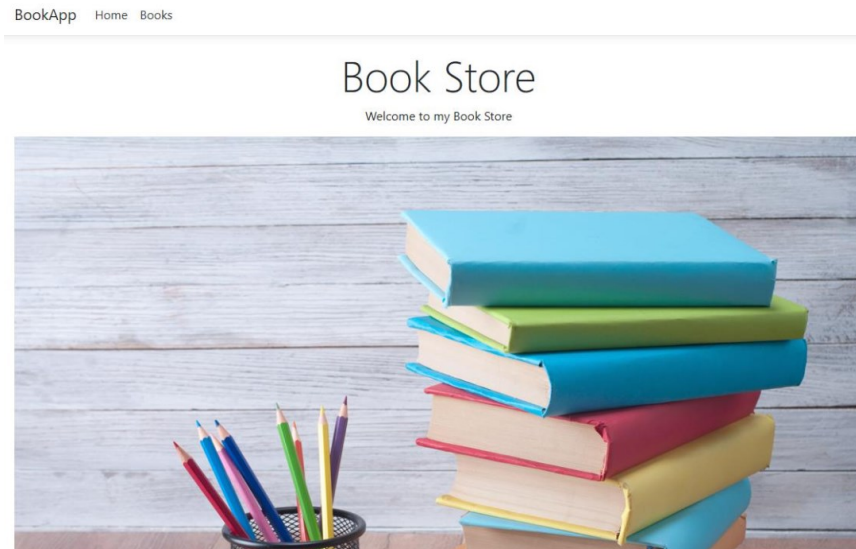

Exercise 2: CRUD (CREATE, READ, UPDATE, DELETE)

The acronym CRUD refers to all the major functions that are implemented for communication with a database.

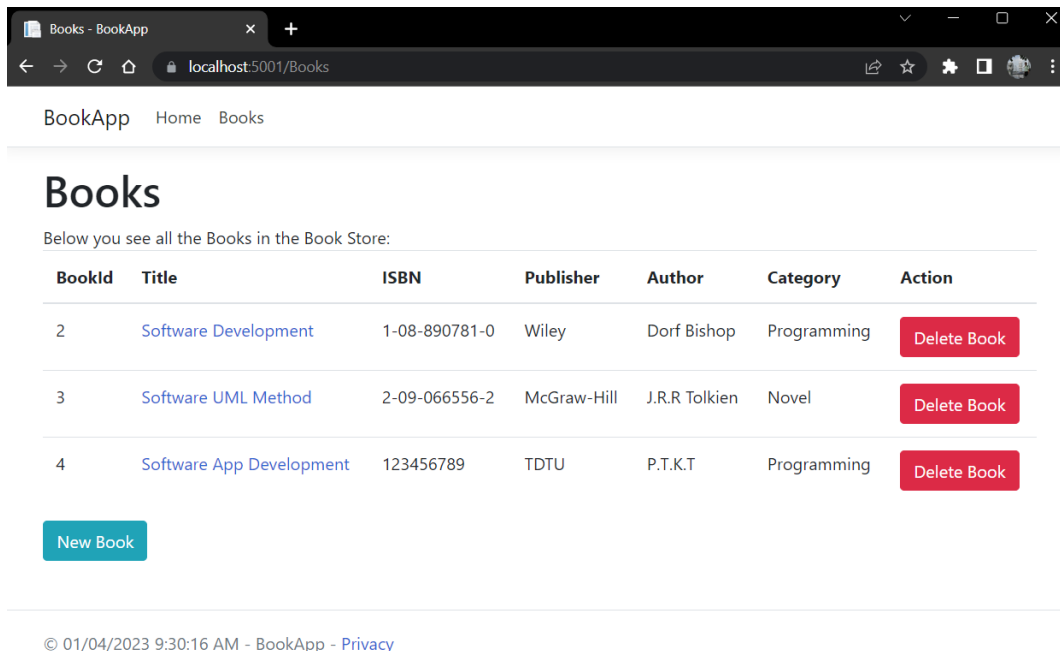

Operation	SQL	HTTP/REST API
Create	INSERT	POST
Read	SELECT	GET
Update	UPDATE	PUT
Delete	DELETE	DELETE

This exercise help you understand how to use ASP.NET Core to get (read, retrieve, select) data from the database, insert data into the database, update the data inside the database and deleting data inside the database.

When I start on a new development project, I just use this application as a template or as a foundation for my new web application.

When click on menu “Books”

Exercise 3 : Based on the Exercise 2, please refer to HRMs (previous Lab with MVC), you are recommended to make HRM App based on ASP.NET Core.

Enjoy 😊
