

Lab10:SE taught by P.T.K.Trung

Exer1: Define test cases with Equivalence partitioning (EP) and Boundary value analysis (EVA) then finish all method with multiple value test case for Lab9 (BasicMath and BankAcct)

-Use [TestMethod] to input multiple test cases (Please see Guide below)

-Use [DataSource] with input test cases in .csv instead of [TestMethod]

Exer2: Self-studied for automation test via <https://www.browserstack.com/guide/selenium-with-c-sharp-for-automated-test> . Please refer this guide for your final project.

Guide for Exer1:

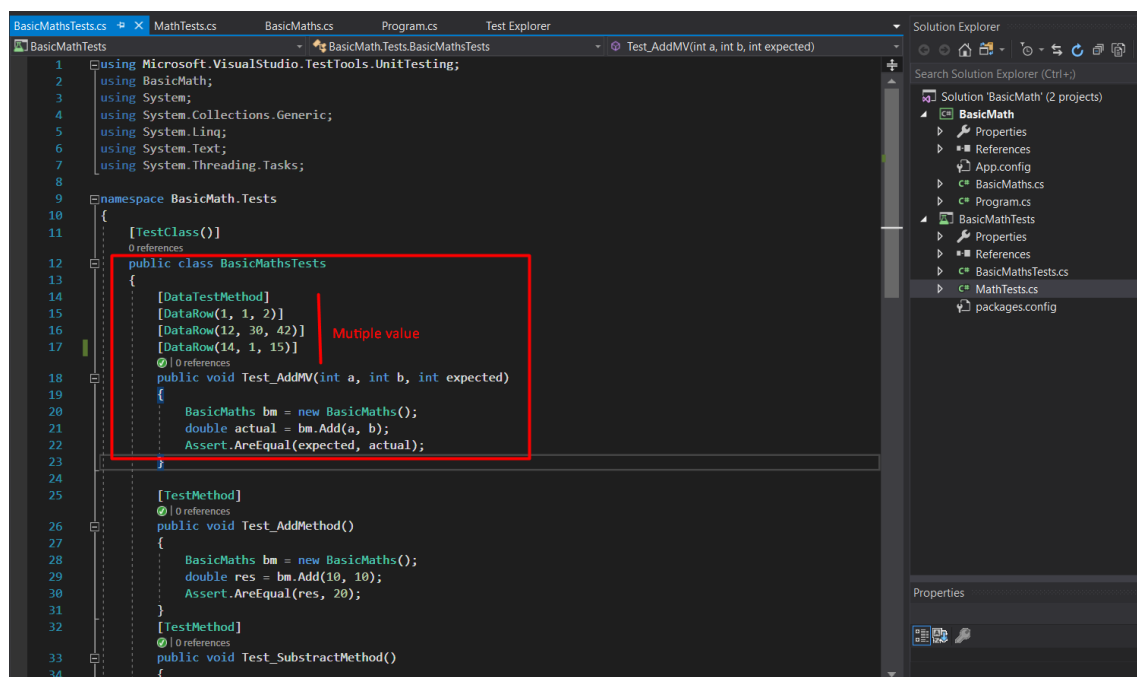

Let's say that we have a Add method:

```
public double Add(double num1, double num2)
{
    return num1 + num2;
}
```

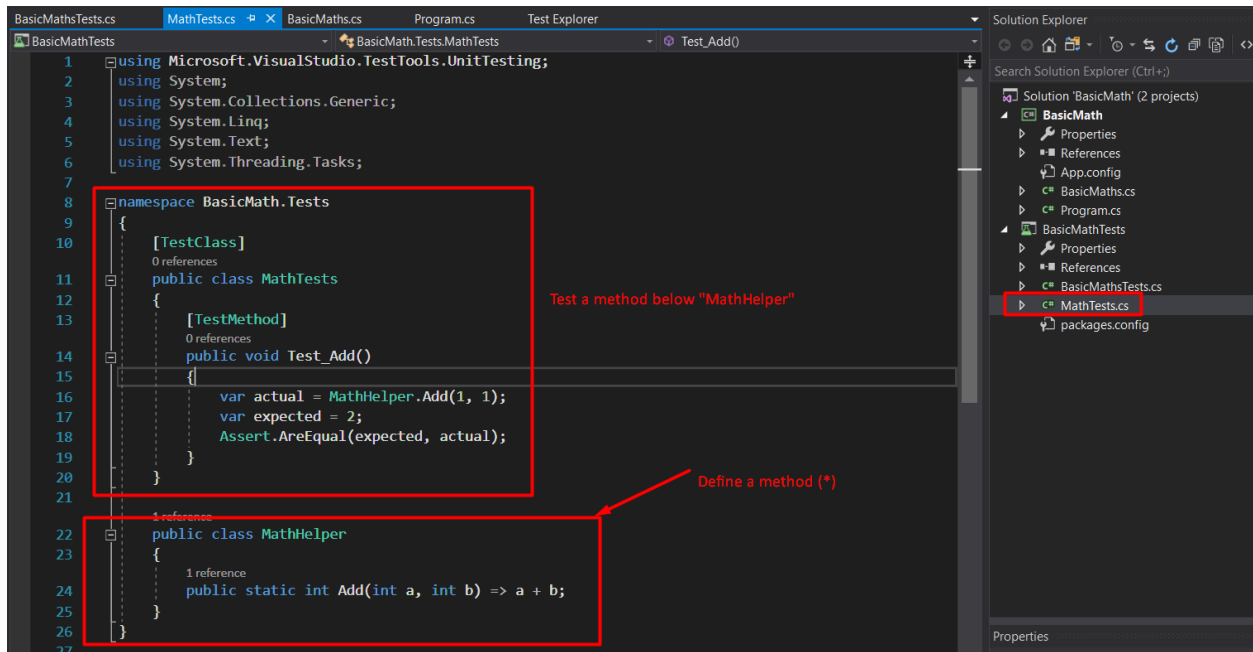

Now, you can use multiple value (test cases) to test a method.

[TestClass()]

```
public class BasicMathsTests
{
    [TestMethod]
    [DataRow(1, 1, 2)]
    [DataRow(12, 30, 42)]
    [DataRow(14, 1, 15)]
    public void Test_AddMV(int a, int b, int expected)
    {
        BasicMaths bm = new BasicMaths();
        double actual = bm.Add(a, b);
        Assert.AreEqual(expected, actual);
    }
}
```

In addition, you can write a code for unit test in the same class:

Test Output:
